Question 3.3.3 Policy Evaluation

What happens to macroeconomic aggregates (Y ; K ; C), to equilibrium prices (w ; r) and the equilibrium distributions for earnings $(1 - \beta)wyl$, income $(1 - \beta)wyl + ra$, assets a and consumption c .

```
% For the distributions, you may want to calculate Gini coefficients
% or if possible, plot the Lorenz curves, under the two different
% specifications.

% Is UBI welfare-improving? To answer this question you may want to
% compare the
% value functions  $v(a; y)$  under the two policies for some combinations
% of  $(a; y)$ ;
% or aggregate (utilitarian) social welfare
